

Blue Wave Trading Precision Indicators

The BWT Precision Indicators are the only indicator of its type to plot trade signals in real time, directly on the bar, in any time frame.

The four indicators are :

- 1. BWT Precision Trend - colored bars**
- 2. BWT Precision TR (Trend Reversal) - the dots and text showing price**
- 3. Precision Stop - dots above or below the bars (3 Stop indicators in one..)**
 - a) Average True Range Stop**
 - b) Volatility Stop**
 - c) Average of Volatility**
- 4. Precision CCI Oscillator Plus Divergence**
 - a) The CCI is the Standard Formula with an option to smooth**
 - b) A dot plots on the CCI Line when the CCI has gone above or below extremes (over bought/sold)**
Due to the characteristics of the CCI, There are two levels of extremes that can be selected by the user, i.e. -200 and -100

A primary feature of our indicators is a clear, concise, visually pleasing graphical format that does not clutter your chart with useless information overload.

In addition to providing a clear trade signal and alert, the BWT Precision Indicators are capable of and often do deliver profound accuracy in its trading signals.

This robustness is supported not only by real time actual trading experience, but also by the ability to back test the indicator signals, as we have programmed the Precision TR to output trade signals to an Excel spreadsheet. This feature is only available in Tradestation™.

Another point that reinforces the indicator's robustness is that there is only one user input - sensitivity, in the BWT Precision Trend and BWT Precision TR Indicator. The Precision Trend, Precision TR, and the Volatility Stop all share the same algorithm.

The BWT Precision Indicators perform across a broad range of time frames and markets.

There are approximately 5 – 6 sensitivity settings that would be used with our indicators –

They are:

.5 (Large Time frames,),

.75 (Some tick and minute charts) ,

1 (tick and minute charts – this is the setting I recommend for most Time Frames) ,

1.4 (Less noise) , 2(even Less Noise) ...

The two screen shots below demonstrate two different sensitivity settings and show the clean, pure and uncluttered nature of our indicators.

The screenshot above is sensitivity of 1.4, below is a sensitivity of 1.

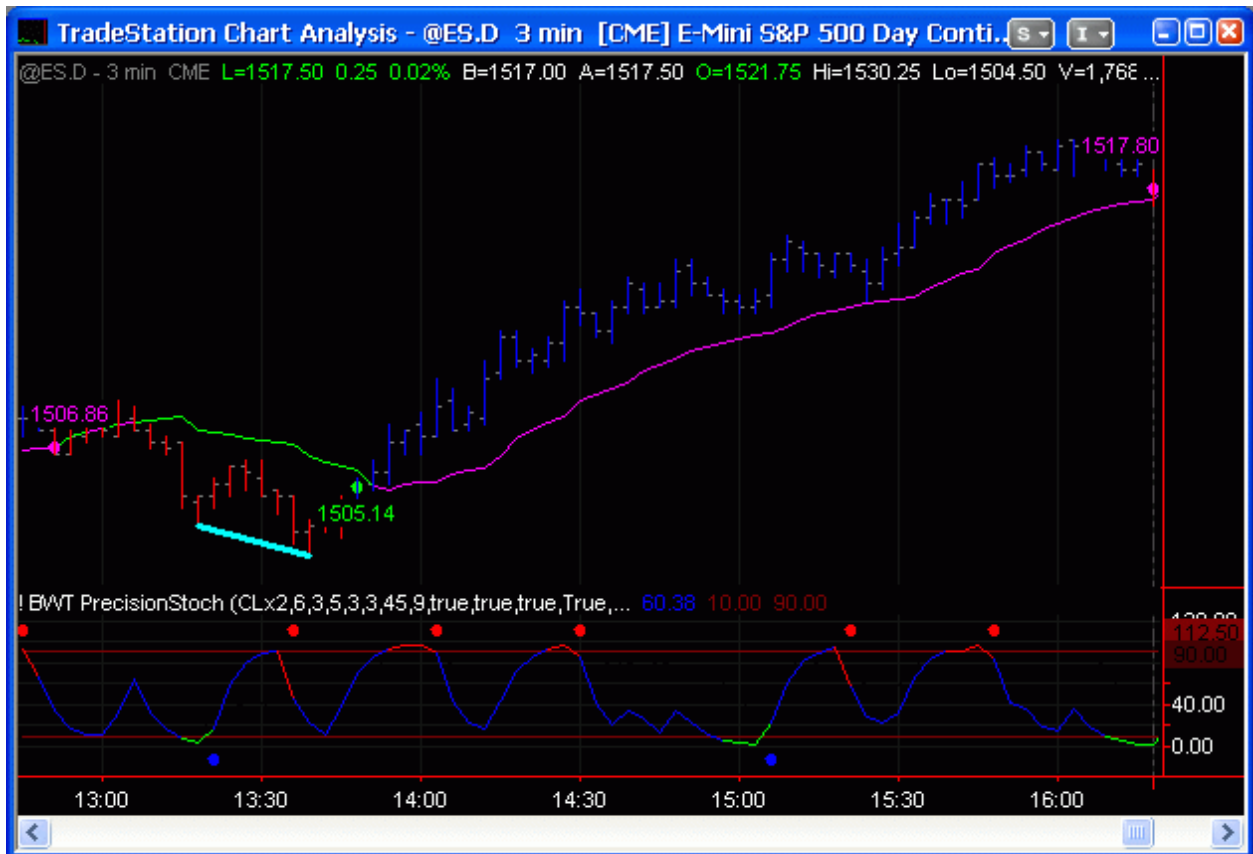

The next Screen shots shows The BWT Precision Stop as an ATR stop and as a Volatility Average.
